ABSTRACT

Describe what your project presents within 150 words.

MovieFlix is a movie search and discovery application designed to help users quickly find movies from a large collection using multiple search criteria. With the rapid growth of streaming platforms, locating relevant content has become challenging due to the vast number of available titles. MovieFlix addresses this problem by providing a simple and efficient interface that allows users to search movies by title, actor, genre, release year, or keywords. The system organizes movie information in a structured database and retrieves accurate results using optimized search techniques. It also displays essential details such as the movie synopsis, cast, genre, rating, and release date, enabling users to make informed viewing decisions. The project aims to improve the overall user experience by reducing search time and increasing the accuracy of search results. MovieFlix demonstrates the practical application of database management, search algorithms, and user-friendly interface design to create a fast, reliable, and scalable movie search solution.
